

# Genetic Testing for Prenatal Diagnosis of Chromosomal Abnormalities

SR Ghaffari, MSc. MD. PhD

# Outline

- Standard Cytogenetics Testing
- Molecular cytogenetics
- Diagnostic Yield of screening methods

# Issues

- Time: 2-3 weeks for results
- Small deletion and duplications will be missed (<5MB)
- Living tissue required

# Data

- Total prenatal diagnosis: 1170
- Abnormal karyotypes: 69

# Data

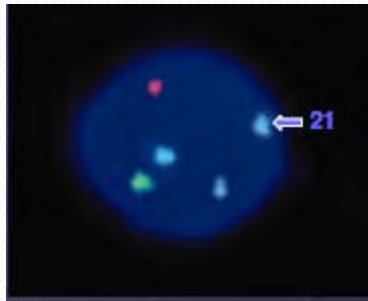

| Reason for referral          | Total | Abnormal karyotype | Positive predictive value |
|------------------------------|-------|--------------------|---------------------------|
| Screen positive              | 974   | 42                 | 4.3%                      |
| Abnormal ultrasound findings | 66    | 7                  | 10.6%                     |
| Advanced maternal age        | 56    | 4                  | 7.1%                      |
| Positive family history      | 45    | 7                  | 15.5%                     |
| Parental anxiety             | 23    | 0                  | 0                         |
| others                       | 4     | 0                  | 0                         |

# Molecular Cytogenetics

**Molecular Cytogenetics**

# Molecular cytogenetic techniques

FISH

QF-PCR

MLPA

Array-CGH

BACs on Beads

# FISH

➤ Quick answers (24-48 hours)

But:

❖ Labor intensive

❖ **You must know what you are looking for**

# QF-PCR

- Quick answers
- Limited to common chromosomal aneuploidies involving chromosomes 21, 18, 13, X and Y

# Array-CGH

- Advantages:

- High throughput
- High resolution

- Disadvantages:

- Costly
- Detecting changes with unknown clinical significance

# ACOG committee opinion

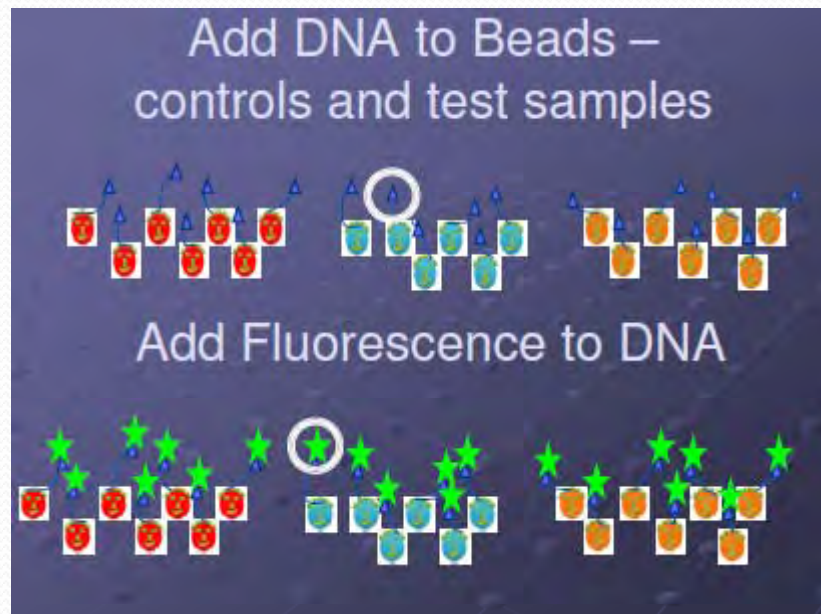

## November 2009

- Array-CGH in prenatal diagnosis
  - Karyotyping remains the principal cytogenetic tool in prenatal diagnosis
  - Targeted array-CGH in concert with genetic counseling, can be offered as an adjunct in prenatal cases with abnormal anatomic findings and a normal karyotype, as well as in case of fetal demise with congenital anomalies
  - Targeted array-CGH may be useful as a screening tool; however, further studies are necessary and are underway to fully determine its utility and its limitations

# BACs on Beads

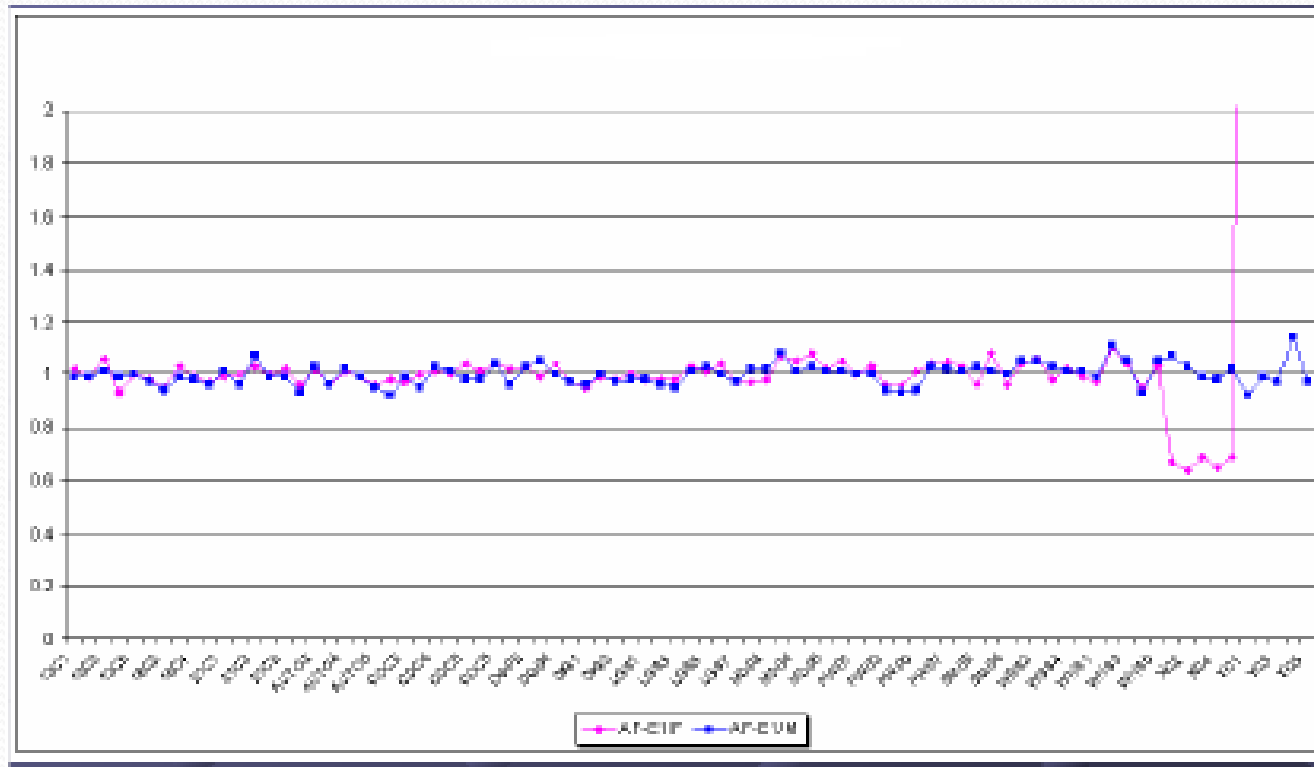

# BACs on Beads

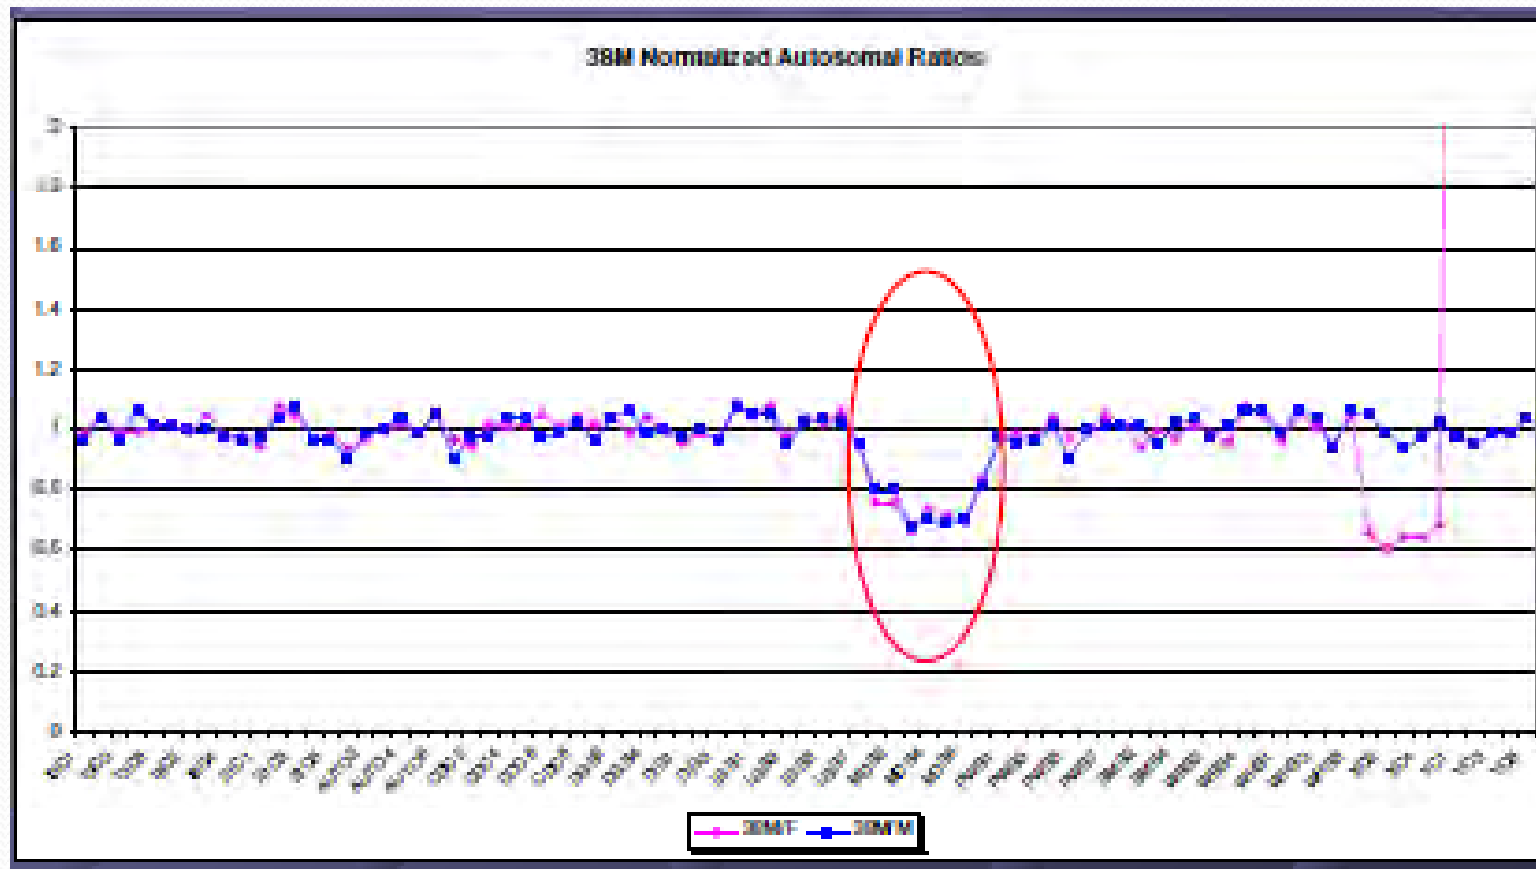

# BACs on Beads

# Analysis, normal

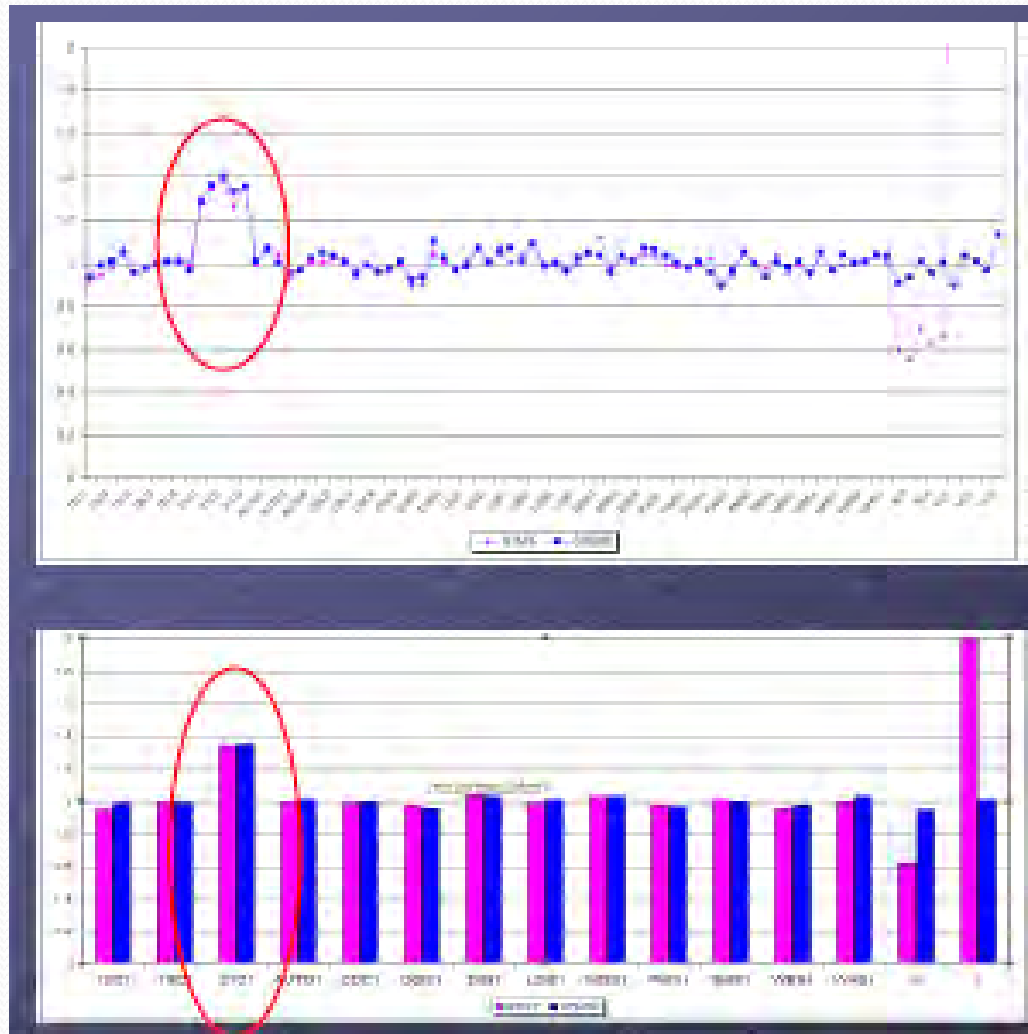

# Analysis, Miller-Dieker syndrome

# Down Syndrome

# Screening of Microdeletion Syndromes

- Indications:
  - Significant morbidity and mortality
  - Relatively common
  - Majority of cases are caused by deletion
  - May be missed on detailed sonography
  - Not detectable by karyotyping

# Microdeletion syndromes

## Microdeletion Syndromes

- DiGeorge syndrome
- Williams-Beuren syndrome
- Prader-Willi syndrome
- Angelman syndrome
- Miller-Dieker syndrome
- Smith-Magenis syndrome
- Wolf-Hirschhorn syndrome
- Cri du Chat syndrome
- Langer-Giedion syndrome
- DiGeorge Syndrome 2

**OVERALL – occurs 1/1600 deliveries**

# Microdeletion Syndromes

- Prevalence: **1/1600** deliveries
- Prevalence of Down syndromes: **1/800** deliveries
- With 4 million deliveries in the US/year
  - Approximately 5700 Down syndrome births per year
  - Approximately 2500 microdeletion syndromes per year

# Screening of Microdeletion Syndromes

- *Would increase detection of serious disorders associated with mental retardation or birth defects by approximately 40%*

# Detection rates

| Conditions                                    | Fraction         | Decimals     |
|---|------------------|--------------|
| Numeric chromosome abnormalities only         | <b>1 in 326</b>  | 0.003        |
| Deletion syndromes only                       | <b>1 in 1426</b> | 0.0007       |
| Deletion syndromes plus numeric abnormalities | <b>1 in 265</b>  | 0.003        |
| <b>Karyotype only</b>                         | <b>1 in 154</b>  | <b>0.006</b> |
| <b>Karyotype plus microdeletion syndromes</b> | <b>1 in 139</b>  | <b>0.007</b> |

# Recommendation

- In otherwise **normal pregnancies** undergoing invasive tests because of advanced maternal age or parental anxiety:  
**aneuploidies and microdeletion syndromes**
- In pregnancies with **abnormal ultrasound findings**:  
**targeted array-CGH analysis**

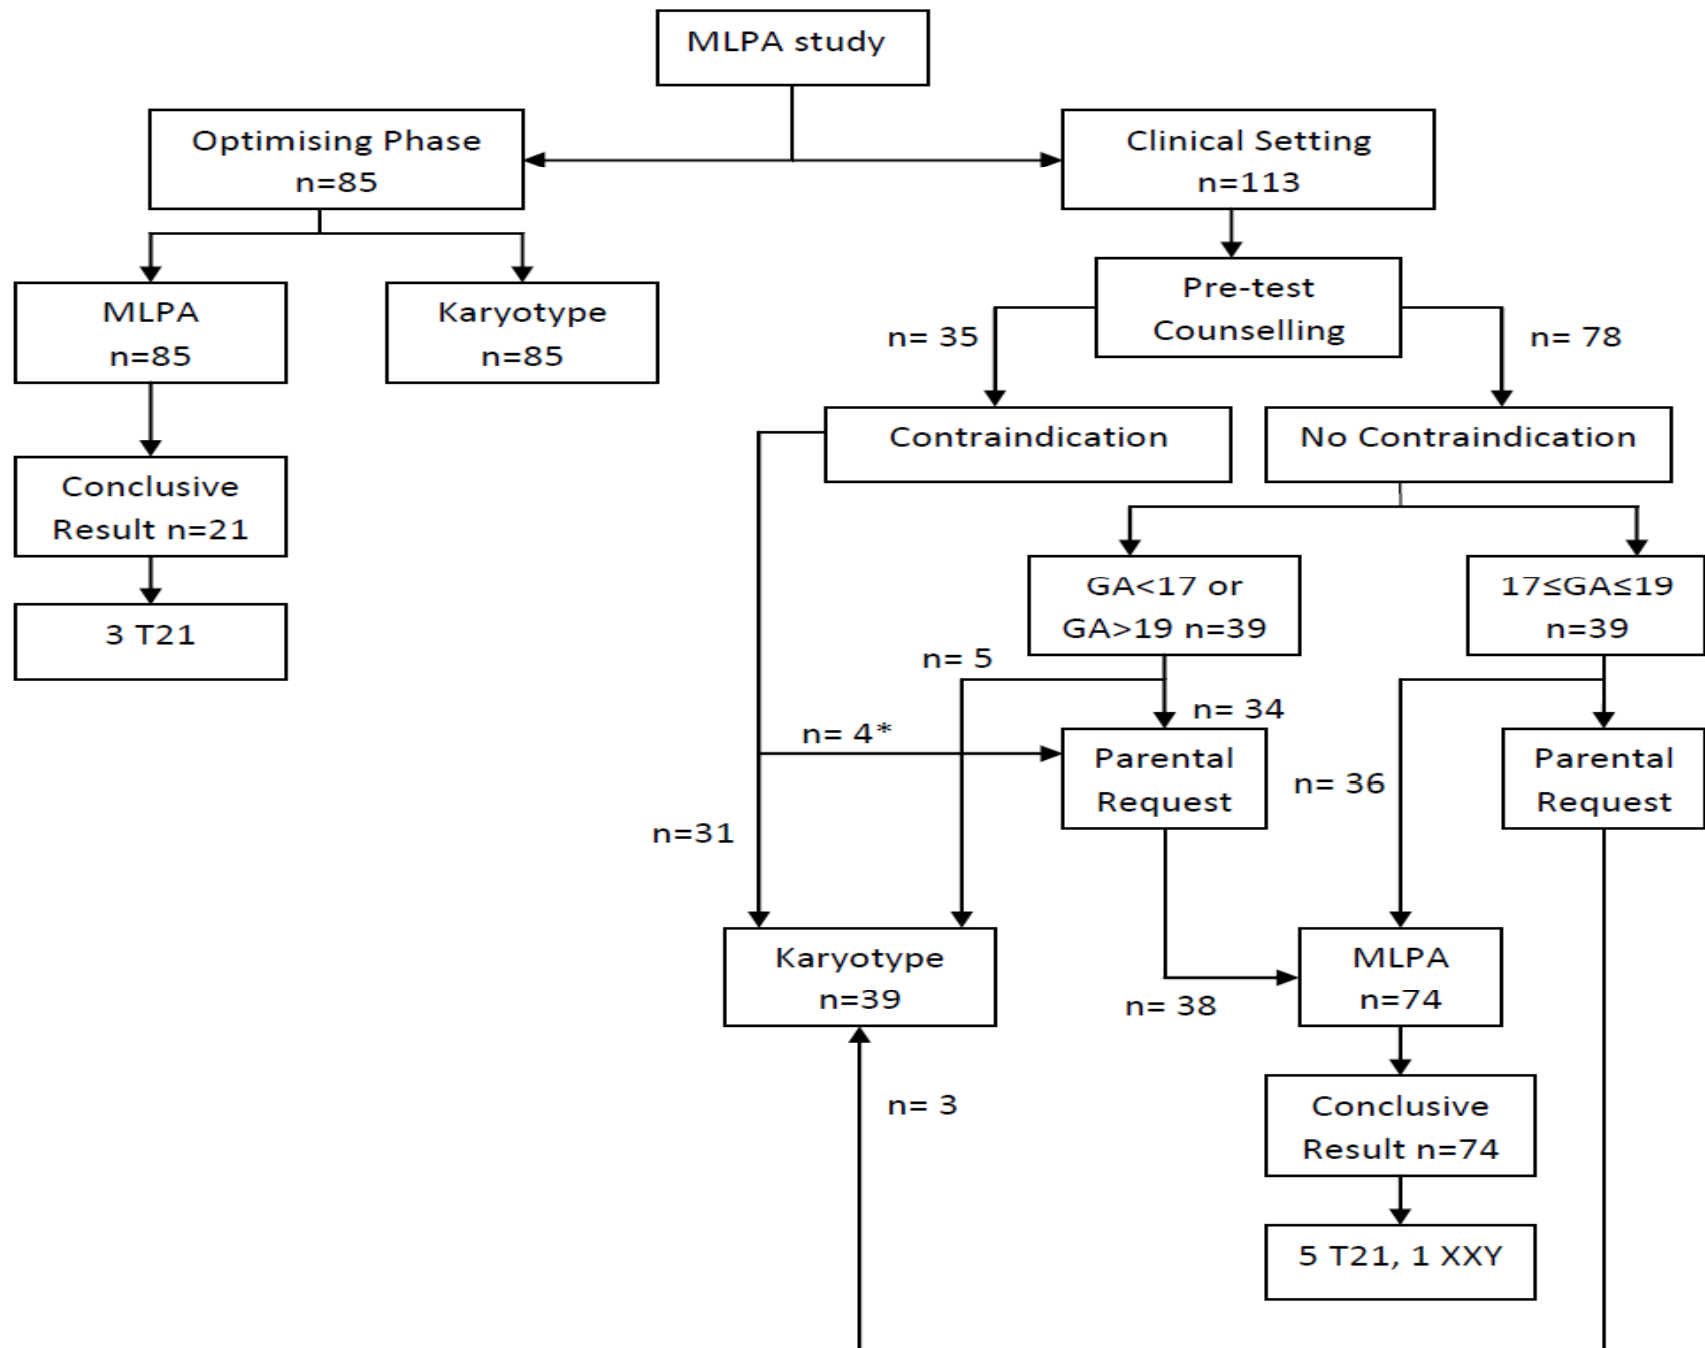

# Our study

**Table 1. Exclusion criteria.**

| <b>Factors</b>   | <b>Variables</b>                       | <b>n</b> |
|------------------|--|----------|
| <b>Parental</b>  | • Pedigree analysis                    |          |
|                  | ○ Previous MR/DD child                 | 1        |
|                  | ○ Family history <sup>♦</sup> of MR/DD | 8        |
|                  | ○ Recurrent abortion/ repeated IUFD    | 5        |
|                  | ○ History of fertility problems        | 5        |
|                  | ○ Family history of congenital anomaly | 2        |
|                  |  | 10       |
|                  | • Parental preference                  |          |
| <b>Fetal</b>     | • Abnormal ultrasound findings         | 3        |
| <b>Technical</b> | • Blood contamination of the sample    | 7        |
| <b>Total</b>     |  | 41*      |

♦ first-degree relatives of the parents, \*2 women opted for MLPA despite the initial exclusion.

**Table 2. Chromosomal abnormalities missed by rapid tests in published studies.**
